Wharton's Jelly vs. PRP — Patient Comparison Guide

Understanding your biologic treatment options at Summit Regenerative Orthopedics

📌 A Note on Pricing & Clinical Integrity

At Summit Regenerative Orthopedics, **both Wharton's Jelly and PRP are offered at the same price.** Our recommendations are based entirely on what is the best clinical fit for *you* — your injury, your joint health, your goals. There is no financial incentive, margin difference, or procedural preference that influences which treatment we recommend. The right biologic for your body is always the right choice.

SIDE-BY-SIDE TREATMENT COMPARISON

Feature	◆ Wharton's JellyUmbilical Cord Tissue Allograft	◆ PRPPlatelet-Rich Plasma
Source	Umbilical cord tissue — ethically sourced from healthy, full-term birth donations. No embryonic cells.	Patient's own blood. Drawn in-office, then concentrated via centrifuge.
Blood Draw Required?	✗ No — no needlestick or blood processing needed from the patient.	✓ Yes — a small blood draw is performed in-office before the injection.

Feature	◆ Wharton's Jelly Umbilical Cord Tissue Allograft	◆ PRP Platelet-Rich Plasma
Key Components	Growth factors • Collagen • Hyaluronic acid (natural joint lubricant) • Cytokines • Mesenchymal stem cells (MSCs)	Concentrated platelets • Growth factors • Fibrin matrix
Lubrication Effect	✓ Yes — hyaluronic acid content directly replenishes joint lubrication and synovial fluid quality.	Minimal — PRP does not contain hyaluronic acid; lubrication benefit is indirect at best.
Collagen Support	✓ Direct — delivers collagen-rich extracellular matrix components to the treatment site.	Indirect — growth factors stimulate the body's own collagen production over time.
Healing Mechanism	Delivers growth factors <i>plus</i> structural matrix components (collagen, HA) directly to the tissue. Acts as a bio-scaffold.	Activates the body's own repair cascade through concentrated platelet signaling. Works with your biology.
Best Suited For	Moderate-to-severe osteoarthritis • Multiple joints treated simultaneously • Systemic inflammation • Patients preferring no blood draw	Tendon & ligament injuries • Mild osteoarthritis • Younger, active patients • Acute or sports injuries
Typical Treatments	1-2 treatments	1-3 treatments
Downtime	Minimal — <i>similar for both options</i>	Minimal — <i>similar for both options</i>
Price	I SAME	I SAME

WHY WE OFFER BOTH

Summit Regenerative Orthopedics was built on a single conviction: **every patient deserves a treatment matched to their biology, not their billing code.** Wharton's Jelly and PRP are not competitors — they are complementary tools in a regenerative medicine toolkit, each with distinct mechanisms and clinical strengths. We offer both because no two patients present identically. A 58-year-old with bilateral knee arthritis and a 32-year-old with a partially torn patellar tendon are not the same patient, and they should not receive the same treatment by default. Our recommendations are driven entirely by your imaging, your symptoms, your history, and your goals — never by what is faster, easier, or more profitable to administer. When you sit down with our team, you will receive a candid, evidence-informed recommendation and a complete explanation of why one biologic is a better fit for you at this point in your care.

WHAT OUR PATIENTS EXPERIENCE

◆ Wharton's Jelly — Typical Outcomes	◆ PRP — Typical Outcomes
Gradual reduction in joint stiffness and swelling over 4-8 weeks, with continued improvement up to 6 months Improved joint mobility and comfort during daily activities, particularly in moderate-to-severe osteoarthritis of the knee, hip, or shoulder Patients frequently report reduced reliance on anti-inflammatory medications and delayed need for surgical intervention	Accelerated tissue repair in tendon and ligament injuries, with many active patients returning to sport or exercise within 6-12 weeks Reduced pain and improved function in mild-to-moderate osteoarthritis, particularly in younger patients with strong baseline healing capacity A natural, autologous treatment — because PRP comes from your own blood, there are no concerns about donor compatibility or allergic response

A Note From Our Physician

"As a non-operative orthopedic surgeon, my goal is to find the biologic that gives your body the best chance to heal — not the most expensive option or the easiest procedure."
